---

I see it has previously been reported the same, so I didn't change it, by why are we (EPA) reporting reading compared to the TCEQ AMCV levels, but TCEQ is reporting "No readings above the Unified Command action level were detected."??

This seems inconsistent.

Bryant,

Attached is the management update draft. The bullet for handheld monitoring and the maps are pending.

The following is the bullet about Braskem workers:

- At approximately 11:30 pm on March 30, Braskem reported elevated benzene detections, and that an individual was vomiting transported to a hospital for observation. He was released after observation and testing. 5 other individuals were under observation at the facility and released.
